Bedwetting is a common medical condition that can and should be treated.

- It is not a psychological issue, but rather is commonly caused by over-production of urine at night, the inability to wake up or reduced bladder capacity.

- This medical condition can have a serious detrimental effect on the child’s self-esteem, emotional well-being and day time functioning, including school and social performance.

- Early treatment in young children (5–6 years) should be recommended.

For more information about this medical condition, please visit our website www.stopbedwetting.org

World Bedwetting Day was initiated and supported by the World Bedwetting Day Steering Committee, which consists of the International Children’s Continence Society (ICCS), the European Society for Paediatric Urology (ESPU), the Asia Pacific Association of Paediatric Urology (APAPU), the International Paediatric Nephrology Association (IPNA), the European Society of Paediatric Nephrology (ESPN), the Sociedad Iberoamericana de Urologia Paediatrica (SIUP) and the North American Paediatric Urology Societies. This initiative is supported by Ferring Pharmaceuticals.
